

Chapter – 3

Purple Online Beauty Shopping Management System

Introduction

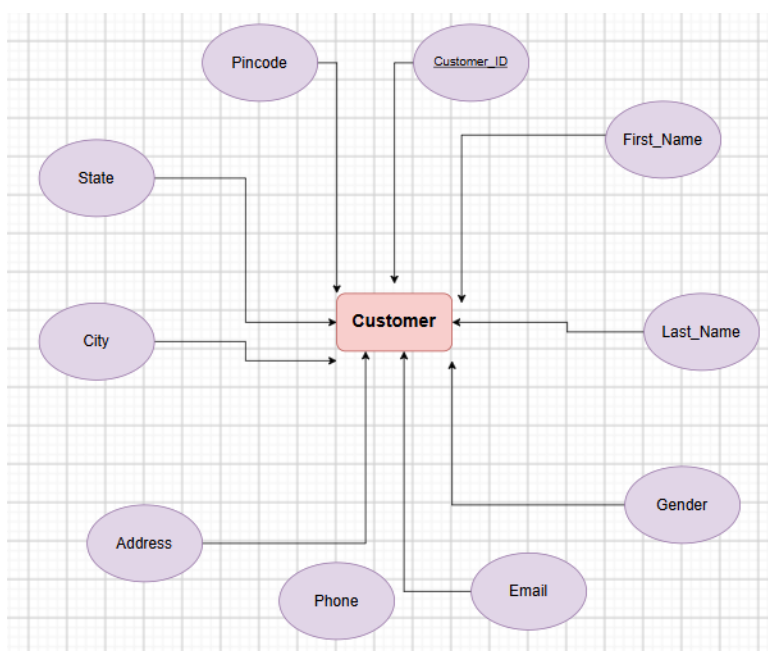

In this stage of the **Purple Online Beauty Shopping Management System** project, the **Entity-Relationship (ER) diagrams** are created to visually represent the structure of the database. Each entity is identified with its attributes and primary keys, while the relationships between entities are defined based on the business requirements of the online beauty shopping platform.

The ER diagrams illustrate how customers, products, categories, suppliers, inventory, orders, order details, payments, and administrators interact within the system. Appropriate cardinality and relationship constraints are used to clearly represent the connections among these entities. This conceptual database design serves as the foundation for creating the relational database schema and implementing an efficient, secure, and well-organized e-commerce database.

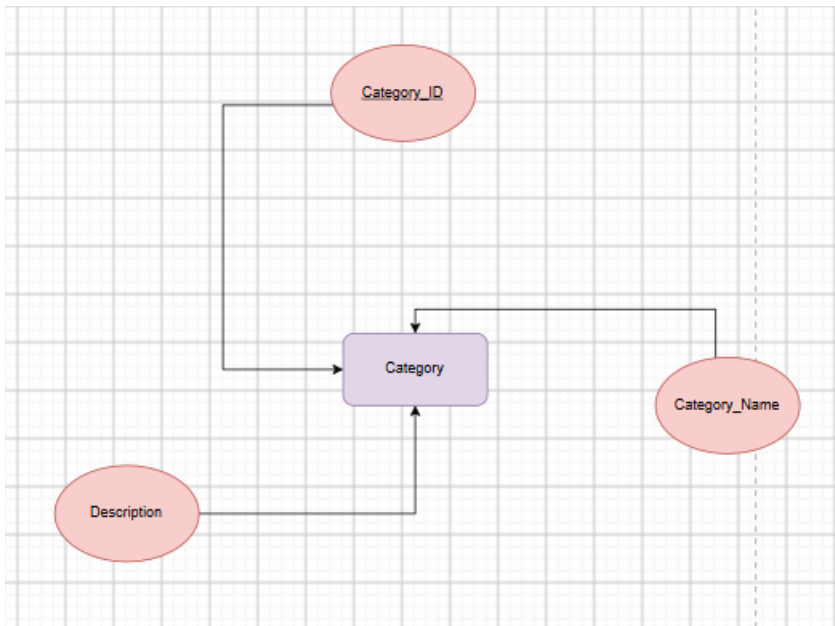

Entity Relationship (ER) Diagram and Relationships

The following ER diagrams represent the entities involved in the **Purple Online Beauty Shopping Management System**. Each entity contains its attributes, primary keys, and relationships with other entities. These diagrams provide a clear understanding of the database structure and help in designing an efficient relational database for the online beauty shopping platform.

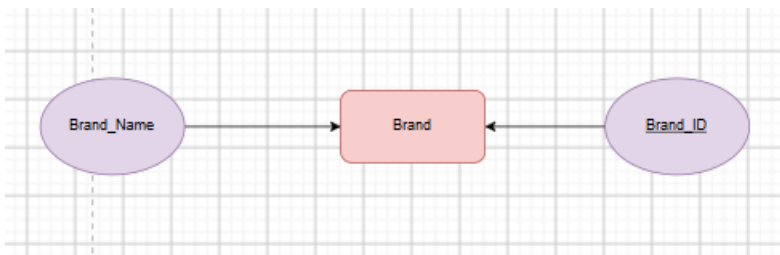

1. Customer

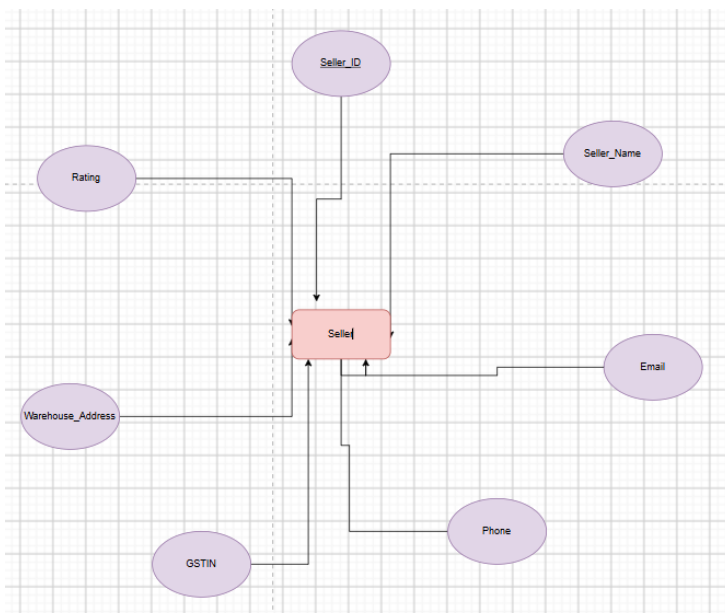

2. Category

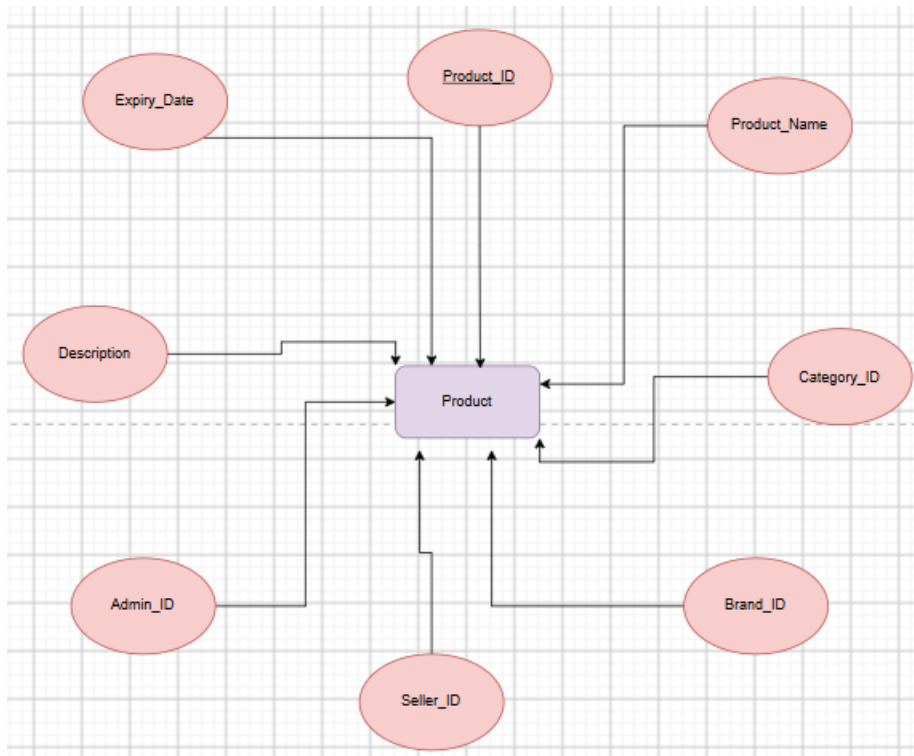

3. Brand

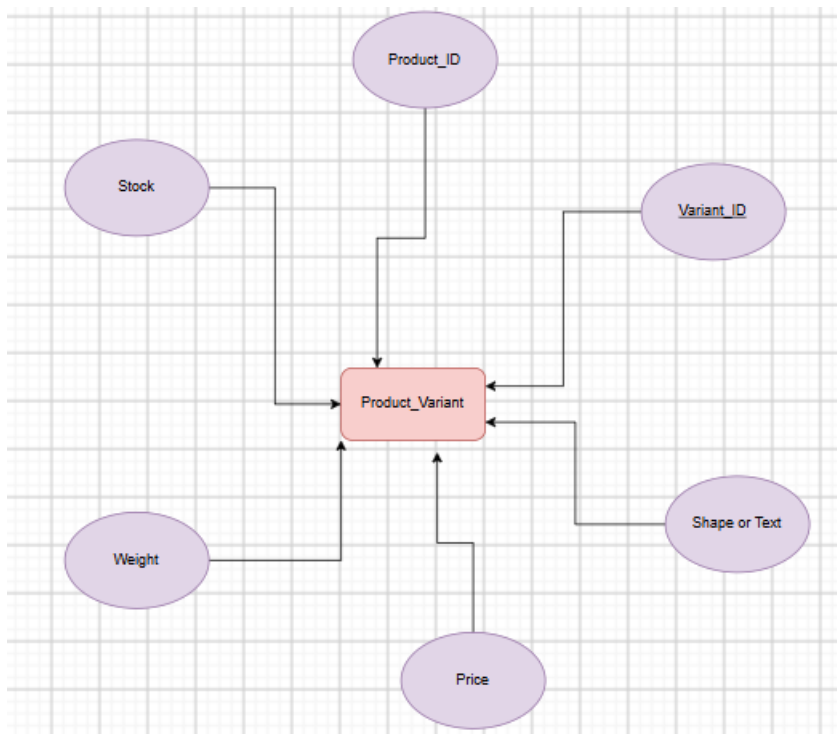

4. Seller

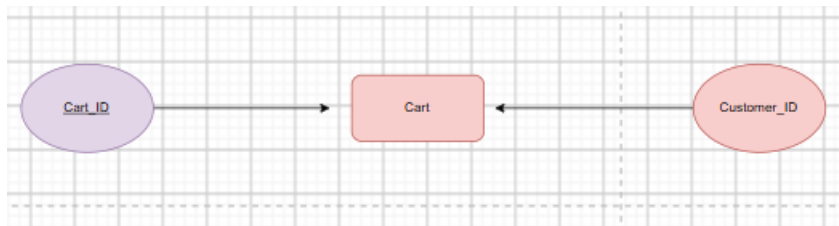

5. Product

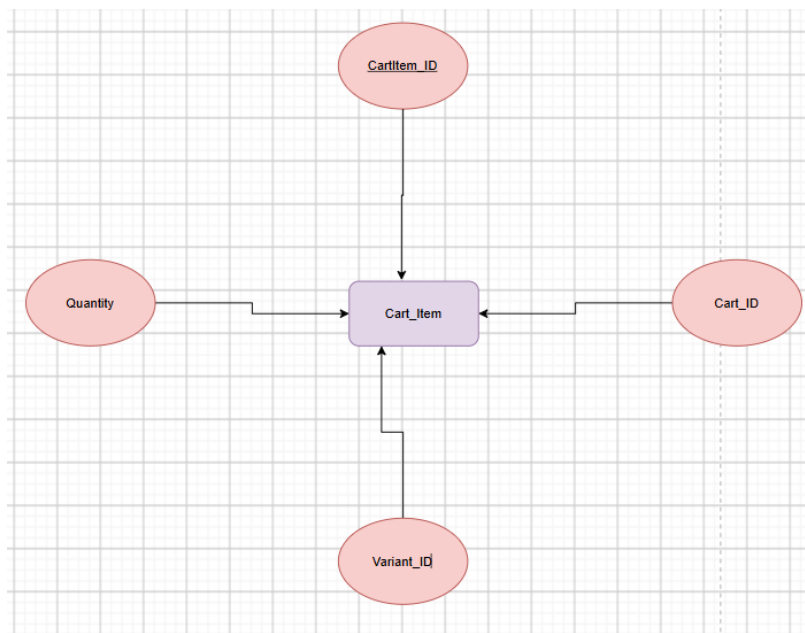

6. Product_Variant

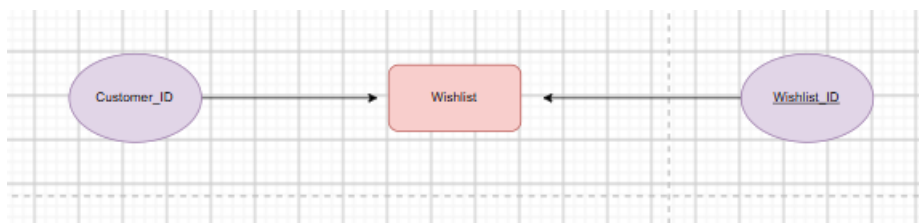

7. Cart

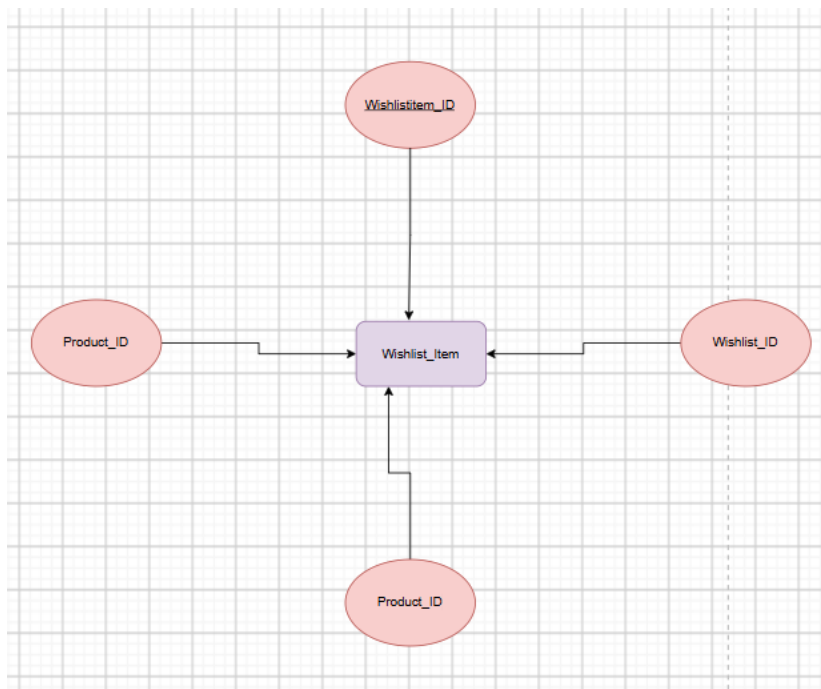

8. Cart_Item

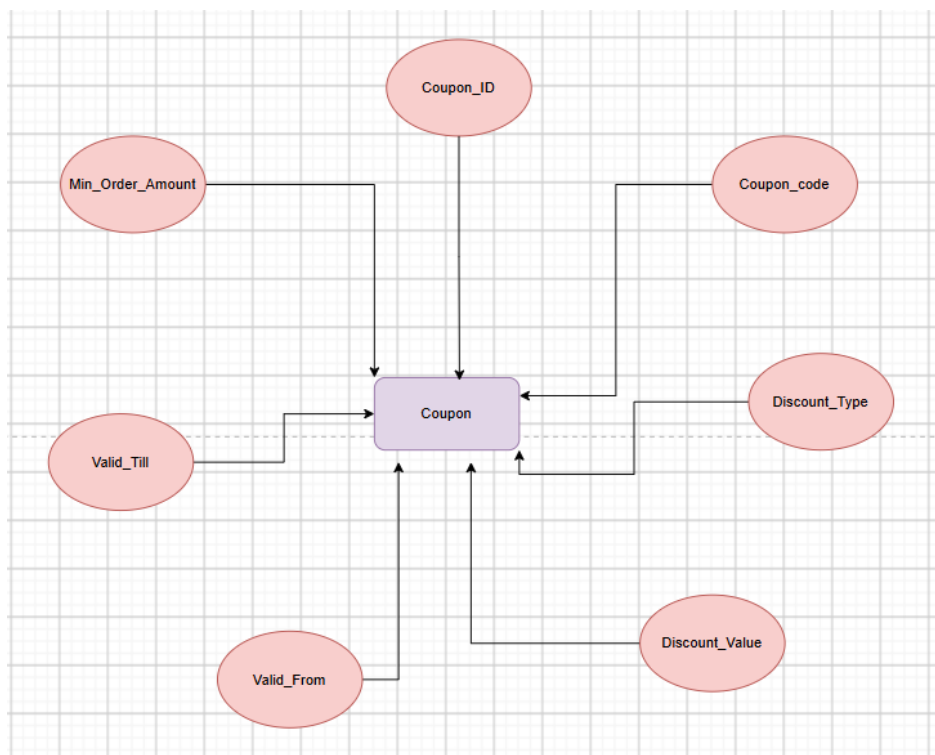

9. Wishlist

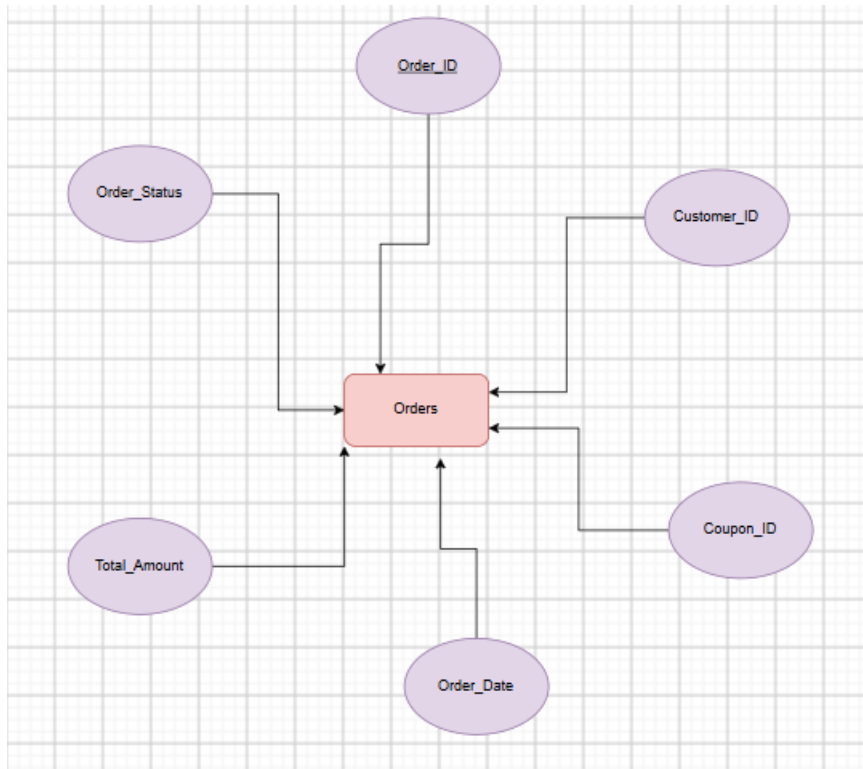

10. Wishlist_Item

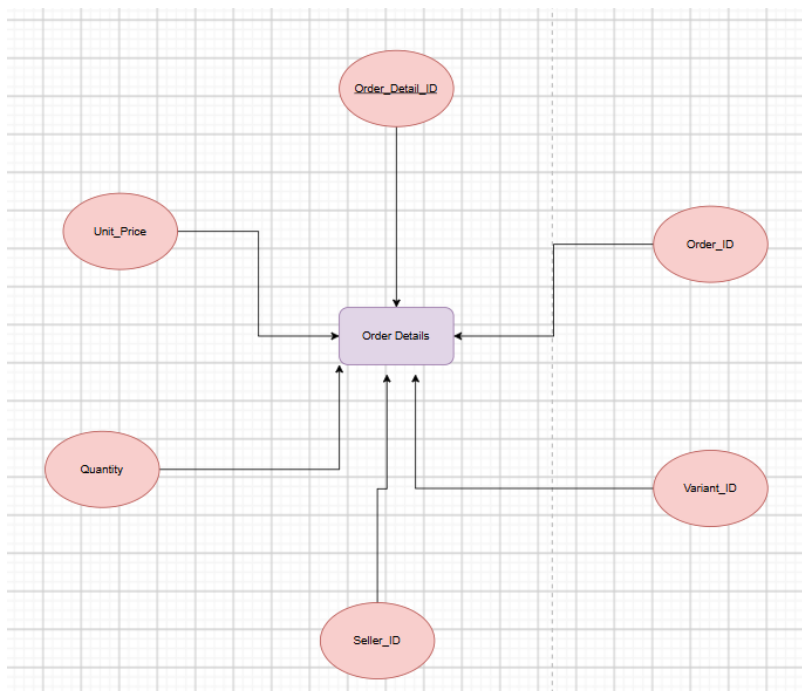

11. Coupon

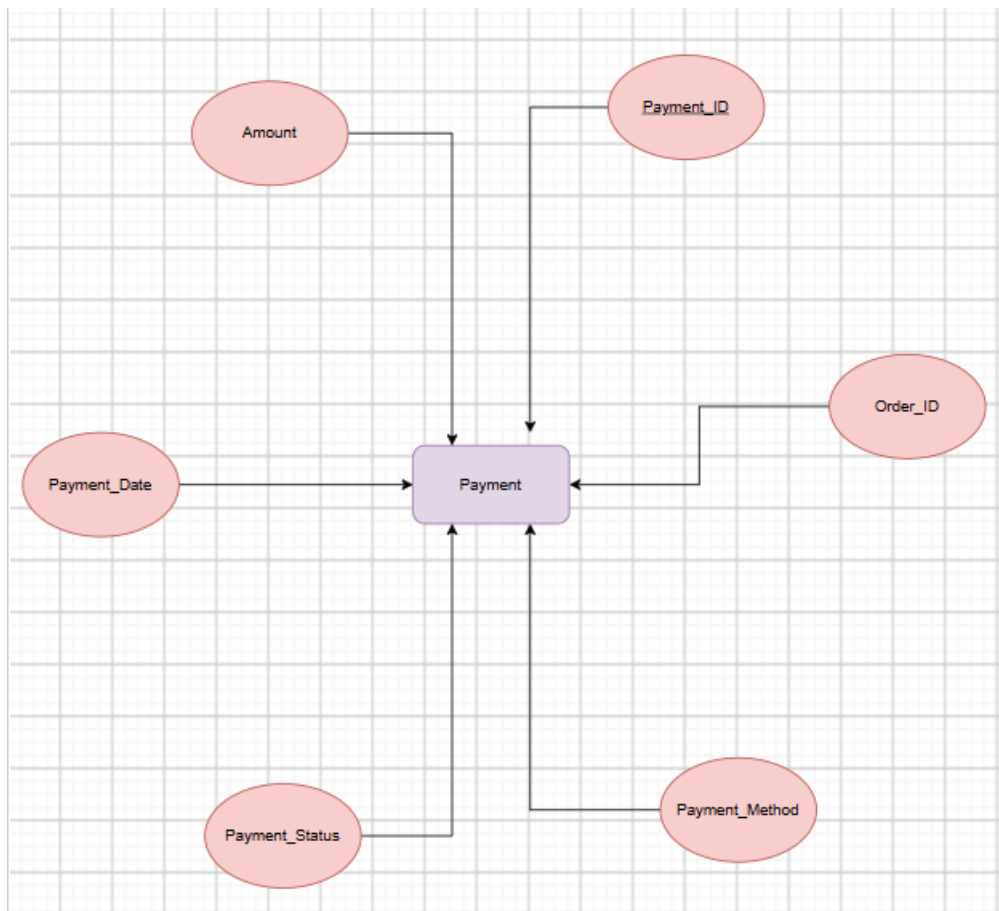

12. Orders

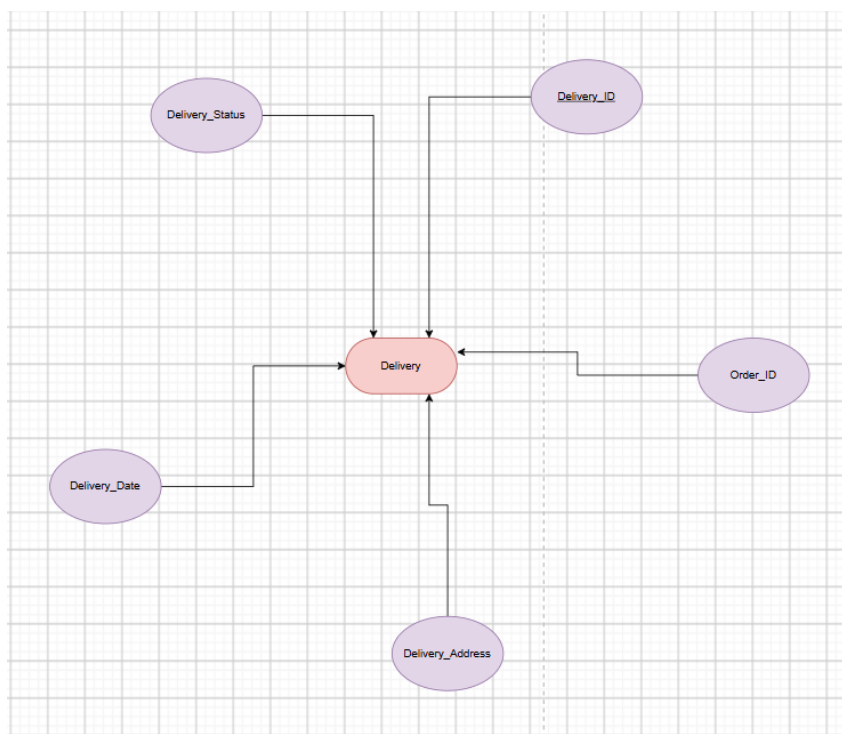

13. Order_Details

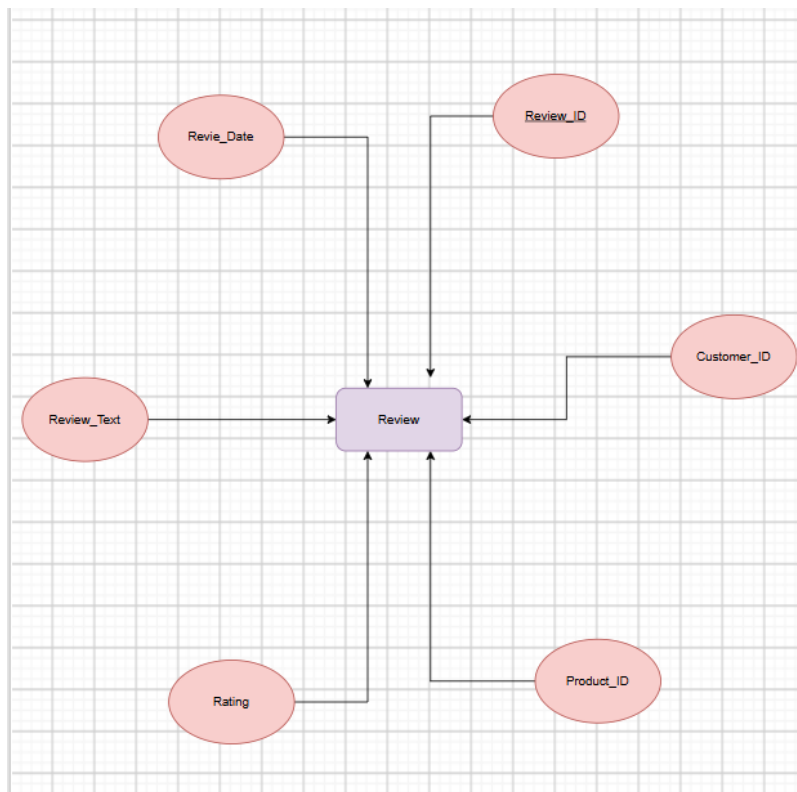

14. Payment

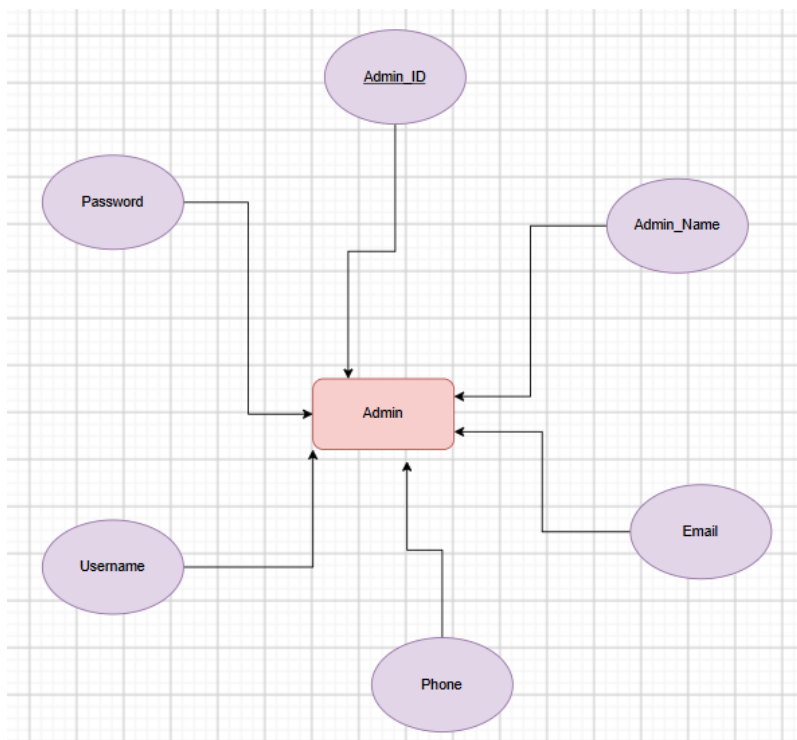

15. Delivery

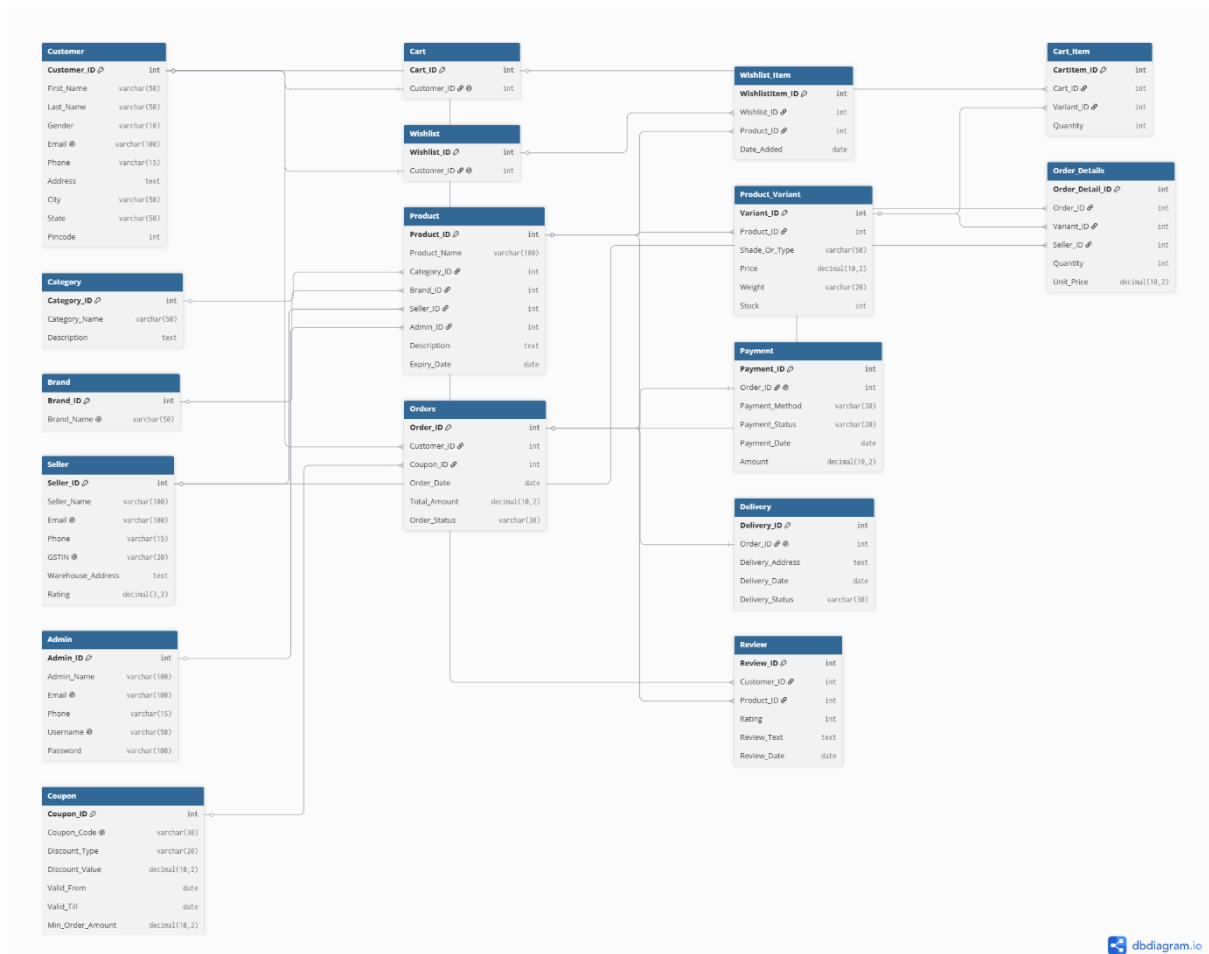

16. Review

17. Admin

18. Relationships

Overall ER Diagram
